Metric Interpretation Report

Using Velocity and Burndown Charts to Support Inspect and Adapt

1. Purpose

The Velocity Chart and Burndown Chart help the Scrum Team inspect progress, identify patterns or deviations, and adapt future plans based on observed results. Metrics are most useful when they prompt discussion and learning, rather than being treated as performance targets.

2. Velocity Chart Interpretation

The chart shows that the team committed to and completed **21 story points in Sprint 1**, and committed to and completed **8 story points in Sprint 2**. Across these two sprints, the average completed work is **14.5 story points per sprint**.

How this informs Inspect and Adapt: the team can use this recent history to support forecasting and sprint planning. The drop from 21 to 8 story points is a signal to inspect, not proof of reduced productivity. The team can discuss possible factors such as capacity, work complexity, availability, or changes in the work selected.

3. Burndown Chart Interpretation

The burndown chart depicts remaining work declining from approximately 21 story points to zero by the end of the sprint. Flat sections indicate periods when the remaining-work line did not change.

How this informs Inspect and Adapt: the team can investigate flat periods during its daily coordination and inspect whether blockers, dependencies, work not yet reaching completion, or delayed chart updates explain the pattern. Based on what it learns, the Developers can adapt their plan to address impediments and improve progress toward the Sprint Goal.

4. Applying the Inspect and Adapt Cycle

- **Inspect:** Review the charts and discuss what the data shows, without jumping to conclusions.
- **Understand:** Explore the context behind changes in completed work or periods with no visible burndown.
- **Adapt:** Agree on practical actions—for example, improving dependency coordination, making work smaller, or clarifying completion criteria.
- **Follow up:** Check in later sprints whether the actions helped delivery and the team's way of working.

5. Where Scrum Events Fit

At the **Sprint Review**, the Scrum Team and stakeholders inspect the product outcome and discuss feedback that may influence future work. At the **Sprint Retrospective**, the Scrum Team inspects how the last Sprint went in terms of individuals, interactions, processes, tools, and its Definition of Done, then identifies useful improvements to try.

6. Key Takeaway

Velocity supports forecasting; burndown helps visualize remaining work during a sprint. Together, they provide evidence for continuous improvement. They should support team learning and realistic planning—not be

used to compare teams or pressure Developers to increase story points.

Interpretation is based on the two charts provided. The charts show only two sprints, so the average is an early reference point rather than a reliable long-term forecast.
